Evaluating generative language models

- Linguistic competence
- Dialogue competence
- Social competence
- Creativity
- Trustworthiness
- Domain knowledge
- Appropriate and conscious behaviour

what is crucial for use for external tasks?

Task 1: Topic

Does the language model know about a topic?

- Can this be self-evaluated by synthetic data generated by the model itself?
- Intention is to run a round-robin task
- We welcome suggestions and contributions!

Task 2: Veracity

Manifold question: truthfulness has many facets

- Many test sets and tasks around this question can be found
- Notably: Shroom at SEM-EVAL this year!
- Builder-breaker set-up
- We welcome suggestions and contributions!

SemEval 2024

SHROOM

- ▶ **Goal:** identify *hallucinations* in NLG outputs containing unsupported information

▶ **Data:**

- ▶ outputs from finetuned PLMs (*PEGASUS, FLAN, NLLB, BART...*)
- ▶ for 3 NLP tasks (*Machine Translation, Definition Modeling, Paraphrase Generation*)
- ▶ sentence-level annotations
- ▶ 5 annotations per datapoint
- ▶ 1000 (val) + 3000 (test) items

- ▶ **Organizers:** E. Zosa, R. Vazquez J. Tiedemann, V. Segonne, T. Vahtola, A. Raganato, T. Mickus, M. Apidianaki

Task 3: Robustness

Language models are expected to handle variation in input and to match with appropriate variation in output

- This task intends to quantify the output variation with respect to a set of observable target variables by varying input prompts systematically
- Variation to model dialectal, sociolectal, and idiosyncratic variation
- We welcome suggestions and contributions!

Task 4: Voight-Kampff test

Can we differentiate human-generated from AI-generated text?

- In collaboration with the PAN lab
- Builder-breaker set-up
- We welcome suggestions and contributions!
